

LESSON 1: WHERE IS OUR URBAN FOREST?

Lesson at a Glance

Grades

- K-2

Duration

- 45-60 minutes

Standards

Arizona Science Standards

- 1.E1U1.5
- 1.L1U1.6

All standards listed at end of lesson

Suggested Sites

- Area with several different trees and other natural features. An elevated area where students can see a larger part of their town or city is ideal.
- This lesson can also be divided into sections that are presented along a walk (e.g., from classroom to schoolyard to park).

Overview

Students will be introduced to their urban forest. They will learn that it encompasses all of the green space, including street trees, parks, schoolyards, landscaped private yards, nature preserves, etc. of their urban area. Students will discuss their favorite things in the urban forest and create a journal entry about their urban forest.

Objectives

Students will be able to:

- Observe and describe characteristics of an urban forest, focusing on their local urban forest
- Define a forest and an urban forest
- Explore their local urban forest and use a nature journal to write and/or draw about their experience

Background Information

In Arizona, when we think about forests, what usually comes to mind are the rugged tree covered mountainous areas south of the Mogollon Rim and the expansive pine forests on the Colorado Plateau. We rarely think of trees along city streets as part of a forest. However, these trees together with those in urban parks, schoolyards, private gardens and backyards, and all other greenspaces and related biotic and abiotic components extending from the urban core to the urban-rural fringe make up our urban forests (Konijnendijk et al. 2006). Urban forests benefit us socially, environmentally, and economically. Social benefits include improved mental and physical well-being, increased social interaction and sense of community, and more beautiful cities. Environmentally, urban forests improve air quality and

provide oxygen. They reduce stormwater runoff, improve water quality, and contribute to water storage. Urban forests provide habitat for wildlife and increase local biodiversity. In Phoenix, the urban forest provides ecosystem services evaluated at \$40.25 million/year, a huge economic benefit. The trees help reduce energy consumption and mitigate the urban heat island effect (Project Desert Canopy).

Preparation

Vocabulary

- **Forest:** An ecosystem that is characterized by a dominance of tree cover and contains a variety of other organisms (e.g., other plants, animals).
- **Urban forest:** includes all the trees and other vegetation in and around a town, village, or city. Plants, people, and animals are part of an urban forest.

Materials

- Book: [*The Forest Where Ashley Lives*](#).
 - This illustrated book is written from the perspective of a seven-year-old. It describes urban forests and contains lots of “Did you know?” facts about trees and forests.
- Nature journal or paper for students to write and draw
- Writing and drawing utensils

Set-Up

- Select an outdoor space to visit with students.
- Ensure students have gathered their nature journaling materials, or bring materials for each student to use outdoors.

Lesson Procedure

Engagement

- Decide to begin in the classroom or the outdoor space with students. If you are going outdoors, review any relevant safety instructions or outdoor learning procedures.
- Share that you will be reading a book as a class about forests and learning about a type of forest called an urban forest.
- Start reading the book “The Forest Where Ashley Lives” to your students. As you make your way through the book, take frequent breaks and relate the information in the book to your location and to students’ experiences. Discuss:

- Are there trees with different leaf shapes?
- Are there birds or insects using the trees as habitats?
- Is there evidence of trees that were cut down?
- Is it cooler under a tree than in the sun?
- How do the trees in your neighborhood compare to the trees in the book?
- What kind of trees does Arizona have that makes this urban forest special?

Exploration

- After reading the book, continue to discuss forests with students:
 - Have any students visited a forest? In Arizona? In another place?
 - What makes a forest? (Trees!)
 - Can forests exist anywhere else? What about in cities?

Explanation

- Introduce students to the term **urban forest**. An urban forest includes all the trees and other vegetation in and around a town, village, or city. Plants, people, and animals are part of an urban forest.
- The large urban areas in Arizona rely on urban forestry for a variety of reasons, such as keeping cities cool and providing spaces for people to spend time outdoors. Ask students what they like best about their urban forest, and why they like it.

Elaboration/ Evaluation

- If you have not already transitioned outdoors, transition to an outdoor setting with trees.
- Using nature journaling materials, students can write about and draw their urban forest. Consider these prompts:
 - What do you think of when you hear “urban forest.”
 - Who and what might live in an urban forest?
 - What do you notice and observe in your urban forest?
 - What do you wonder about in your urban forest?
